

## **School of Computing & Information Sciences** Senior Project, 2017, Fall

Mobile Judge 10.0 Student: Shahinaz Elmahmoudi, Florida International University

Mentor: Masoud Sadjadi, Florida International University Professor: Masoud Sadjadi, Florida International University

Problem

 The Senior Project Showcase is one of the most important events held for soon to be graduating Computer Science students looking to show off their work at the end of the semester. With alumni, professors, and people in the industry all in attendance, some will adjudicate, appraise, and evaluate the showcased work. A coordinating platform is crucial to be able to effectively host such an event.

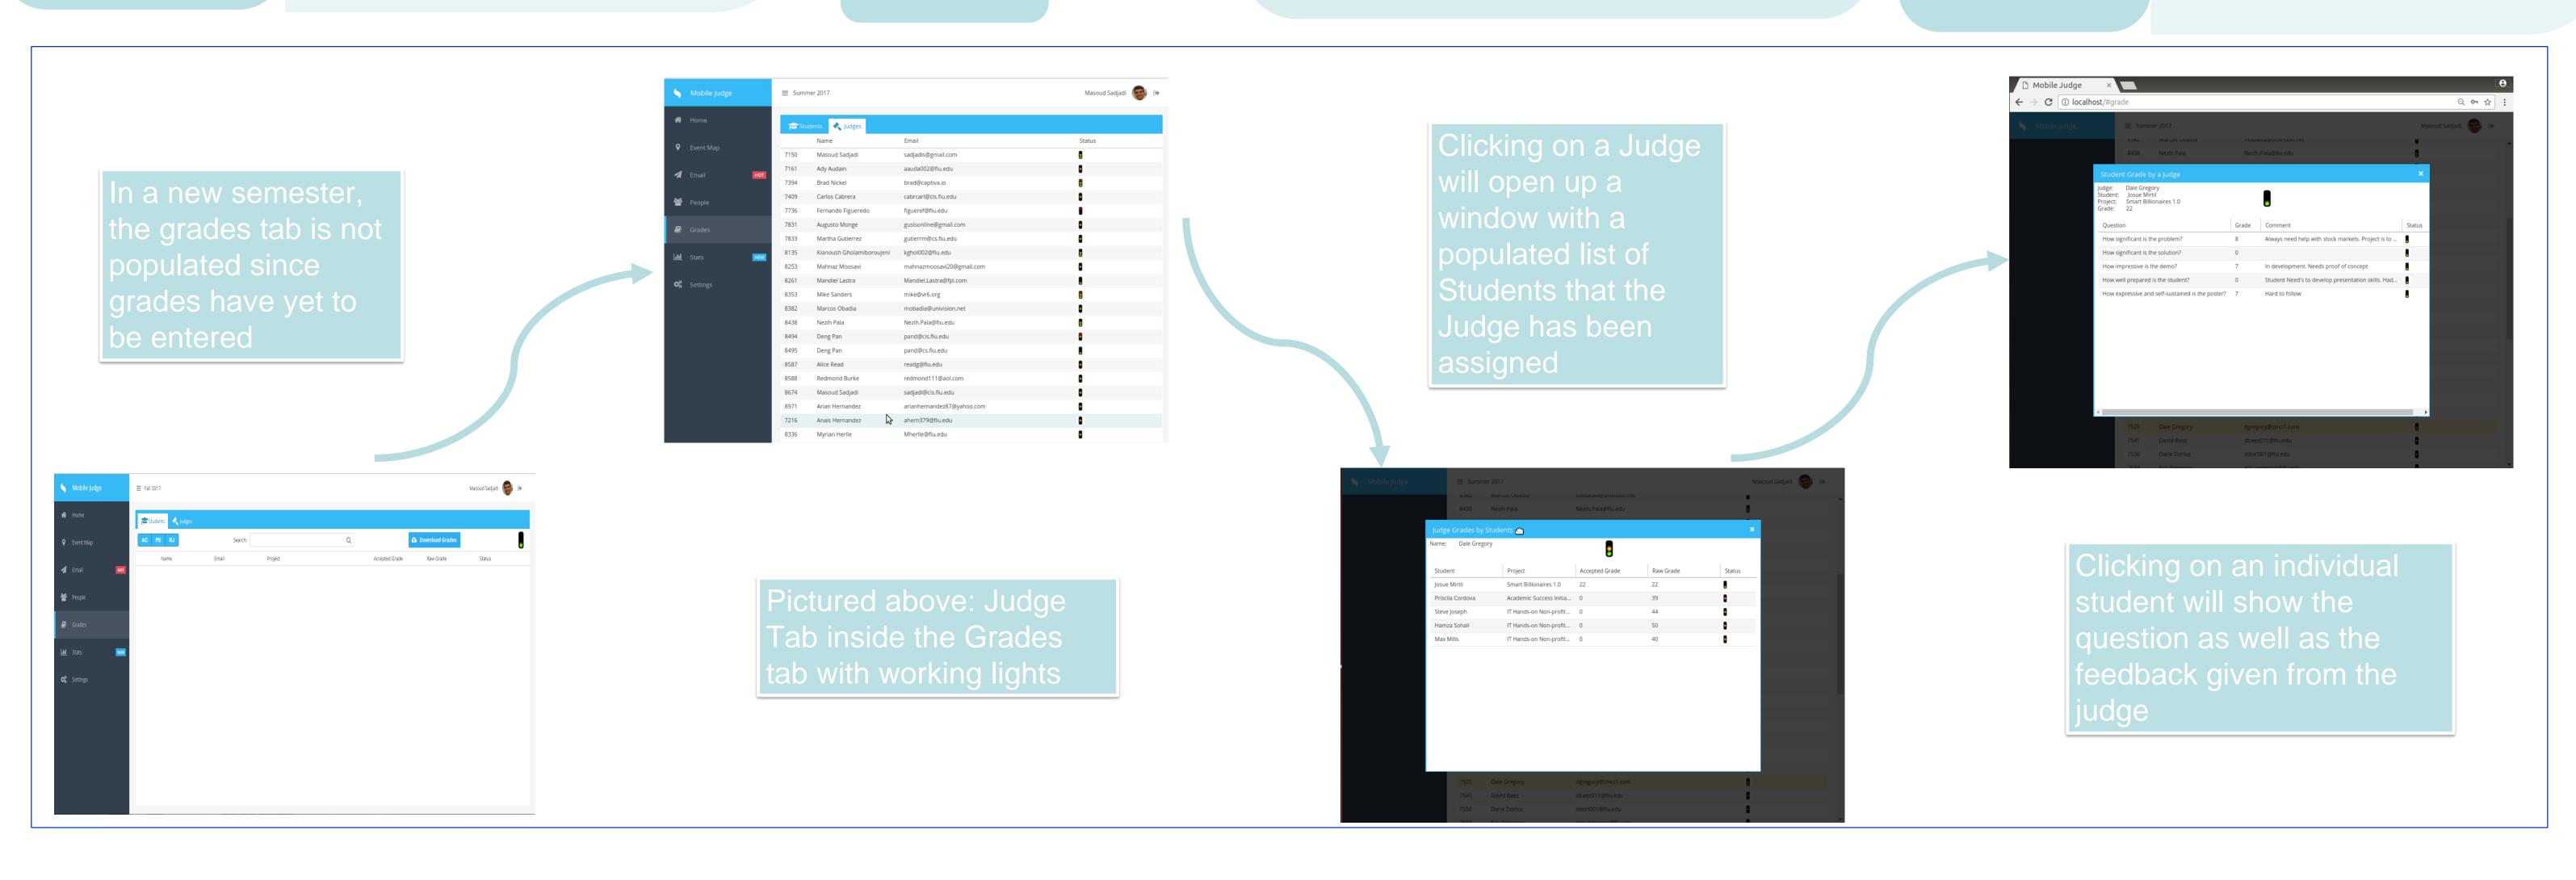

Solution

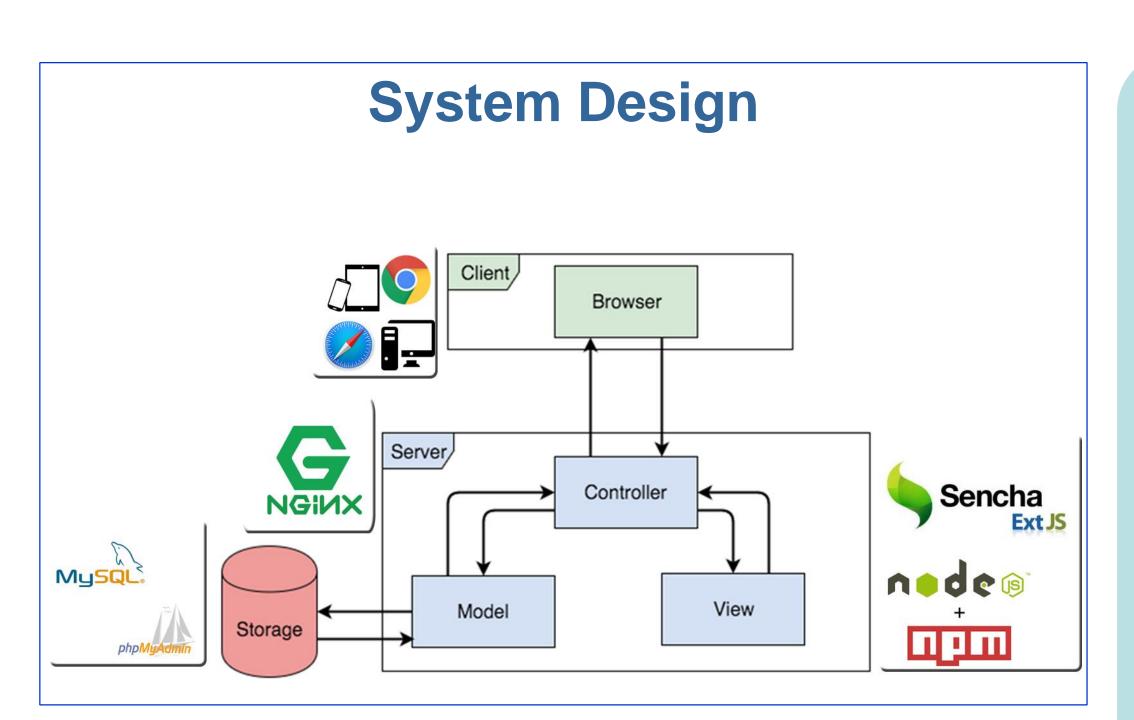

Mobile Judge was created in order to have a centralized web-based application that addresses the needs of the students, judges, and administration simultaneously. The platform allows students to view their grades and any feedback that a judge may have left. It allows judges to be able to know the names and locations of the students that they will be assessing. It also allows them a central location to record their evaluations. Administration can manage emails, users, and grades while concurrently keeping a record of all pertinent information.

Current System

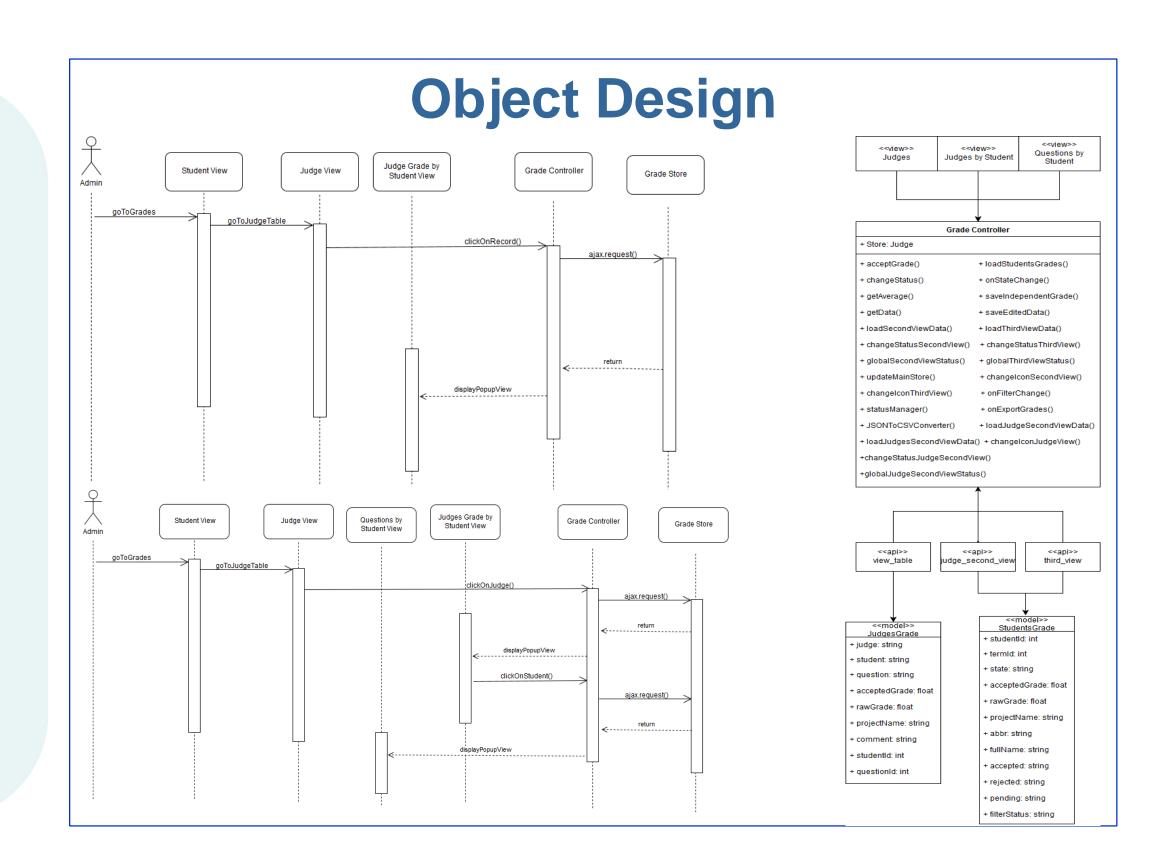

- Allows Judges: to register onsite at the event, to grade students and leave feedback, to view locations
- Allows admins: to see both a student and judge view of the grades tab, to see statistics, to approve/pend/deny grades, to send emails, to change certain settings, and to synchronize new semesters
- Allows students: to view their grades after the event as well as a location map

Requirements

- The requirements that were necessary for this version of Mobile Judge offers Admins:
- A web-app that can populate new terms cleanly without old grades appearing from students who were in the class before
- A new way to view individual judges and a list of their students to globally or individually approve, pend, and/or deny a judge's decision
- In that same view, admins can click on a individual student and view the feedback given by the judge

**Implementation** 

- OAuth used for Authorization
- NodeJS as backend
- NGINX is used as the server to run OAuth and NodeJS
- PHPMyAdmin and MySQL used for database
- Web-App is hosted on FIU server
- Ubuntu 14.04 used as virtual machine for development
- Sublime text editor mainly used for programming environment
- Sencha ExtJS used for cross browser support

## Verification

Summary

 Mobile Judge is an ongoing project aimed at providing a better user experience before, during, and after the showcase for students, judges, and its administrators. In version 10.0 focus was placed on adding more usability for the admin, allowing them to use the new views to make decisions quicker and more effectively.

Acknowledgement

The material presented in this poster is based upon the work supported by Dr. Masoud Sadjadi. I am thankful to the help that I received from my group members, Pablo Alcocer, Guillermo Matos, and Alberto Camacho.
